

10 International ISAAC conference

Period: 5 Aug 2015

Sirkka-Liisa Eriksson (Member)

Department of Mathematics

Description

Chair person of a session Quaternic and Clifford analysis

Related event

10 International ISAAC conference

3/08/15 → 8/08/15

Macau, Macao

Activity: Participating in or organising an event › Chair of workshop, panel, session or tutorial

11th Workshop on Positioning, Navigation and Communication 2014, WPNC'14, Dresden, Germany, March 12-13, 2014 (Journal)

Period: 2014

Simo Ali-Löytty (Reviewer)

Research group: MAT Positioning

Free Boundary Problem in 3D Geometry

Period: 12 Aug 2015

Jukka-Pekka Humaloja (Speaker)

Department of Mathematics

Description

We present a numerical method for detecting perfectly conducting objects in a homogeneous medium in 3D. The method is based on minimizing an objective function that depends on Cauchy data given on the surface of a sensor, near which the conducting objects are located. The objective function is derived from Green's second identity with the fundamental solution of the three-dimensional Laplacian. The functional has linear and nonlinear parts, which is utilized in the minimization.

Inverse problem in electrostatics with free boundary

Period: 10 Jan 2014

Jukka-Pekka Humaloja (Speaker)

Department of Mathematics

Description

Consider an electrical potential u satisfying Laplace's equation on a plane region with mixed boundary conditions. We are interesting in solving a parametrization for one of the domain's boundary curves based on Cauchy data on the opposite boundary. The problem is solved with a variation of alternating field technique on inverted plane. Let v be the harmonic conjugate of u . Then the function $u(x, y) + iv(x, y)$ is analytic and it has an inverse $x(u, v) + iy(u, v)$. The functions x and y satisfy Laplace's equation on a rectangle, and the unknown boundary curve maps to unknown boundary conditions in the

rectangle. The unknown boundary conditions are solved using the alternating-field technique.

On Detecting the Shape of an Unknown Object in an Electric Field

Period: 12 Jun 2014

Jukka-Pekka Humaloja (Speaker)

Department of Mathematics

Description

The problem discussed in this paper is detecting the shape of an unknown object in a 2-dimensional static electric field. For simplicity, the problem is defined in a partially rectangular domain, where on a part of the boundary the potential and/or its normal derivative are known. On the other part of the boundary the boundary curve is unknown, and this curve is to be determined. The unknown part of the boundary curve describes the shape of the unknown object. The problem is defined in the complex plane by an analytic function $w=f(z) = u(x,y)+iv(x,y)$ with the potential u as its real part. Then the inverse function is given as $f^{-1}(w) = x(u,v)+iy(u,v)$, where the functions x and y are harmonic in a rectangle with an unknown boundary condition on one boundary. The alternating-field technique is used to solve the unknown boundary condition.
