

Tampere University Prize for teaching excellence and the development of teaching

Tero Juuti (Recipient)

Automation Technology and Mechanical Engineering

Description

The justifications for the prize state that the previously lecture-based teaching in the course has been replaced by problem-based learning in small groups. The justifications also highlight participatory methods that involve students, and the transdisciplinary development of teaching and supervision across the boundaries of subjects and units. In addition to the teachers in the course, the course has been planned and implemented by academic officers, study psychologists, and experts in entrepreneurship, speech communication, and the Library's information retrieval specialists. Master's students in speech communication also taught communication and interaction skills in the course. The team: University Instructor Mikko Vanhatalo (ENS/Kone), Associate Professor (tenure track) Tero Juuti (ENS/Kone), University Instructor Juha Nykänen (ENS/Mat), University Instructor Sanna Auvinen (ENS/Mat), University Instructor Johanna Ruoranen (ENS/Mat), Senior Research Fellow Helena Leppäkoski (ENS/Aut), Senior Specialist Mervi Miettinen (Library), University Lecturer Sanna Ala-Korttesmaa (ITC/speech communication), Visiting Researcher Ulla Saari (MAB/entrepreneurship), Academic Officer Hanna Lehtelä (ENS)

Future Circular Collider Study Innovation Award 2017

Jussi-Pekka Penttinen (Recipient)

Mechanical Engineering and Industrial Systems, Research area: Design, Development and LCM

Description

The CERN Future Circular Collider (FCC) Study Innovation Awards celebrate and honor the most exciting tech and scientific developments in the FCC collaboration. The year 2017 award was given to Jussi-Pekka Penttinen, who is a doctoral student in Tampere University of Technology and works also as a chief architect of the ELMAS software in Ramator. The award goes for the design work on an open and scalable modelling and simulation platform to understand and optimise the reliability, availability and energy efficiency properties of the particle accelerator complex.

The work is not only essential for the design of a future collider, but it efficiently leverages the existing infrastructure at CERN and can also find many applications in the industry. A large internationally active energy supply company got interested in the work on FCC to apply the method and tool for design work of a new type of liquefied natural gas (LNG) terminal. Also for example reliability of paper machine components, availability of data center infrastructure and failure tolerance of final disposal facility for spent nuclear fuel have already been analyzed with the approach.

Top 2% Position in Kaggle What's Cooking Competition

Oguzhan Gencoglu (Recipient)
Research group: Personal Health Informatics-PHI, Department of Signal Processing

Description

If you're in Northern California, you'll be walking past the inevitable bushels of leafy greens, spiked with dark purple kale and the bright pinks and yellows of chard. Across the world in South Korea, mounds of bright red kimchi greet you, while the smell of the sea draws your attention to squids squirming nearby. India's market is perhaps the most colorful, awash in the rich hues and aromas of dozens of spices: turmeric, star anise, poppy seeds, and garam masala as far as the eye can see. Some of our strongest geographic and cultural associations are tied to a region's local foods. This competition asks you to predict the category of a dish's cuisine given a list of its ingredients.

3rd Place in TUT Head Pose Estimation Challenge

Oguzhan Gencoglu (Recipient)
Department of Signal Processing

Description

Head pose estimation is to estimate the viewing angles (yaw and pitch) of human head given a facial images, which is a hot and active research topic in computer vision. Specifically, the structured output labels (i.e. yaw and pitch angles of head) in this problem are continuous discrete integers, which can be formulated into a regression or classification. We leave this as an open option for the participants. In this competition, given training data, each team will use machine learning tools to learn a model to map two-dimensional output labels from imagery features. The trained model will be tested with the provided validation data by the participants for the purpose of further improvement. In the evaluation stage, each team is required to submit the predicted results given the testing data to the website, which will be evaluated by the website automatically.

ICHI2016 Healthcare Data Analysis Challenge

Oguzhan Gencoglu (Recipient)

Research group: Personal Health Informatics-PHI, Department of Signal Processing

Description

Patients and caregivers often share their health-related concerns in community forums and discussion boards such as ehealthforums, medhelp, and patientslikeme. On such discussion forums, members post questions and other members respond with suggestions or answers to the leading question. This provides a rich environment for healthcare researchers to study question-answering challenges in healthcare. One of the important tasks towards automated question answering is to identify the type of questions being asked by the patients and their caregivers. The task of the healthcare data analytics challenge was to develop machine learning solutions to automatically classify given forum messages into 7 categories. A second place has been won by Oguzhan Gencoglu in the competition.
