## **Abstract**

New ways of combining digital and physical innovations, as well as intensified inter-organizational collaborations, create new challenges to the protection of organizational knowledge. Existing research on knowledge protection is at an early stage and scattered among various research domains. This research-in-progress paper presents a plan for a structured literature review on knowledge protection, integrating the perspectives of the six base domains of knowledge, strategic, risk, intellectual property rights, innovation, and information technology security management. We define knowledge protection as a set of capabilities comprising and enforcing technical, organizational, and legal mechanisms to protect tacit and explicit knowledge necessary to generate or adopt innovations.

## **Introduction**

In our connected knowledge society, organizations benefit from exchanging knowledge with external parties but have to protect themselves against those that seek to appropriate critical knowledge (Jarvenpaa and Majchrzak 2016). Increased connectivity and current technological trends have shortened digital innovation cycles compared to traditional innovations, which makes innovations more difficult to protect. Digital innovations predominantly rely on innovative ideas and knowledge (Yoo et al. 2012). Due to the tacit nature of knowledge and its boundedness to humans, pure technical approaches cannot provide the needed level of protection (Olander et al. 2014). Rather, an integrated perspective that builds on several research fields is needed.

The protection of knowledge has so far been considered from different domains (Ahmad et al. 2014; Manhart and Thalmann 2015; Norman 2002): information technology security management, knowledge management, strategic management, risk management and innovation management. These domains tackle the Knowledge Protection (KP) issue from different angles and perspectives. However, the foci of these domains vary considerably. We argue that a comprehensive perspective on KP is needed for the following reasons: (1) Digital innovations become more intangible over time (Amara et al. 2008; Yoo et al. 2012). Knowledge-intensive innovations require different measures for protection (Ahmad et al. 2014). (2) Shorter innovation cycles of digital innovations increase the pressure to collaborate (Schilling 2015). (3) Organizations have to assimilate external knowledge from more dispersed sources on multiple sectors, locations, and cultural settings (Malecki 2010), forcing organizations to collaborate in innovation processes and to produce more complex outputs. (4) The use of social software for collaboration in innovation processes creates many opportunities for knowledge sharing and can facilitate innovation processes (Kane et al. 2014) while increasing risks (Väyrynen et al. 2013). (5) Current trends in society, as well as the popularity of social software, increasingly blur the borders between private and business lives (König et al. 2014). This situation facilitates creativity for innovation processes but also creates additional risks of unwanted knowledge spillovers (Ahmad et al. 2014; Huang et al. 2015).

The overall research question is:

*What is Knowledge Protection and what are its implications for the management of digital innovations?*

## **Background**

In knowledge management, KP is designated as a core strategy (Bloodgood and Salisbury 2001) but has received little attention to date (Manhart and Thalmann 2015). Strategic management literature mainly focuses on knowledge as an organizational asset in dyadic relationships, such as joint ventures or cooperation of large international enterprises, but neglects complex relationships, such as in networks (Hernandez et al. 2015; Pahnke et al. 2015). Risk management studies concentrate on business risks to already established organizational assets yet disregard the threats to emerging innovations (Ilvonen et al. 2015). Studies on IT security management emphasize well-categorized and classified resources and communication channels but underestimate the protection needs of knowledge that is bound to humans and communications supported by social media (Ahmad et al. 2014; Väyrynen et al. 2013). Finally, innovation management research highlights the formal protection of innovation processes by using contractual agreements in large companies (Amara et al. 2008) but rarely focuses on informal measures (Olander et al. 2014). Legal measures to ensure appropriation of IPRs are also well researched; however, measures for small- and medium-sized enterprises (SMEs), such as patents, are often unaffordable (de Faria and Sofka 2010).

All of the reviewed base domains distinguish between tacit and explicit knowledge. Tacit knowledge is embodied in employees and is especially emphasized in knowledge, strategic and innovation management studies, and to some extent, in risk management research. The risk management, IPR and information security literature focuses on explicit knowledge that can be stored in Information Systems. In addition to the tacit and explicit dimensions, the distinction between strategically important knowledge (valuable in the long term) and operationally important knowledge (valuable in the short term) is made. Therefore, strategic, innovation and IPR

management studies emphasize strategically important, competitive knowledge, whereas the other domains highlight both strategically and operationally important knowledge or do not make this distinction.

Taking the six base domains into account, four major goals are relevant to KP, as follows: (1) protecting against unwanted leakage of knowledge, (2) assuring availability of knowledge, (3) countering unconditional knowledge sharing, and (4) appropriating revenue streams. Thus, KP aims to ensure operational and competitive advantage, and threats to knowledge are regarded as coming from both inside and outside the organization. Nondisclosure agreements for teams, awareness training programs, or interpersonal trust building are measures that stakeholders strive to implement at the individual level. Almost all the base domains focus on protection at the organizational level. The KP frameworks, security policies, and organizational measures are aimed for organization-wide implementation. At the inter-organizational level, behavioral control and trust building are used to reduce opportunistic behavior.

## **Research Plan**

We plan a structured literature review, which will be conducted by following the advice of Webster and Watson (2002) and Schultze (2015). The intended review has characteristics of both systematic and interpretive reviews (Schulze 2015). The review will be undertaken in three stages, as follows: (1) identifying the relevant literature, (2) structuring the review, and (3) contributing to theory.

In stage (1), we will conduct a full review of the top journals in the general IS and management fields and the top journals in the six base domains identified in the initial review (see Table 1). We will cover the issues over the last ten years since we expect the lion's share of publications on KP

and digital innovations from 2005 until the present time. The selection of journals will be based on their rankings if available (Azar and Brock 2008; Crossan and Apaydin 2010; Serenko and Bontis 2013). We will complement the review with backward and forward searches of highly cited articles (Webster and Watson 2002). To identify potentially relevant papers, we will apply the building-blocks approach (Rowley and Slack 2004), transforming relevant concepts into search statements and extending the statements by using synonyms and related terms.

In stage (2), we will supplement the search for papers with the development of a concept matrix (Webster and Watson 2002) that identifies the main elements of analysis. We will adapt the starting elements of the concept matrix from the work of Seidel et al. (2010), such as “domain,” “research methods,” or “role of IS.”

**Table 1. Targeted journals**

IS Senior Scholars’ Basket of Journals: European Journal of Information Management, Information Systems Journal, Information Systems Research, Journal of AIS, Journal of Information Technology, Journal of MIS, Journal of Strategic Information Systems, MIS Quarterly					
General Management Journals: Management Science, Organization Science, Administrative Science Quarterly, Academy of Management Journal, Academy of Management Review					
Knowledge Management	Strategic Management	Risk Management	IPR Management	Innovation Mgmt.	Security Management
Journal of Knowledge Management	Strategic Management Journal	International Journal of Risk Assessment and Management	European Journal of Intellectual Property Review	Research Policy Journal of Product Innovation Management	Computers and Security
International Journal of Knowledge Management	Journal of Economics & Management Strategy	Journal of Risk Research	Journal of Intellectual Property Rights	Regional Studies	Information and Computer Security
Knowledge Management Research & Practice	Long Range Planning	Journal of Risk Research	International Review of Intellectual Property and Competition Law	Technovation	ACM Transactions on Information and System Security
Journal of Information & Knowledge Management	Strategic Entrepreneurship Journal	Journal of Risk Management			IEEE Transactions on Information Forensics and Security

In stage (3), we plan to adopt the informed-inductive coding approach described by Patton (2005), using the coding software ATLAS TI. The first goal is to develop a KP definition that incorporates the specifics of the identified base domains. Therefore, we strive to identify patterns within and across the base domains, using the concept matrix. Second, we aim to support our propositions with more comprehensive reasoning, resulting from a more profound description of the KP concept in the base domains and a more in-depth definition of the term.

### **Summary**

In this paper, we indicated that KP has received different degrees of attention from various research domains, whose foci also vary considerably. Thus, we propose to integrate these perspectives on KP to extend the scope of IS research on digital innovations. Based on our initial literature review, we define KP as a set of capabilities comprising and enforcing technical, organizational, and legal mechanisms to protect tacit and explicit knowledge that are of strategic or operational importance to an organization. Therefore, KP focuses on both (1) external threats of leakage and exploitation by unauthorized parties and (2) internal threats of unavailability and loss. Finally, we have presented our plan on how to continue the literature review.

### **Acknowledgements**

The Know-Center is funded within the Austrian COMET Program - Competence Centers for Excellent Technologies - under the auspices of the Austrian Federal Ministry of Transport, Innovation and Technology, the Austrian Federal Ministry of Economy, Family and Youth and by the State of Styria. COMET is managed by the Austrian Research Promotion Agency FFG. This work has been partially sponsored by the FFG Project 855383 SALSA (ICT of the Future).
